

**UNIT 1**

Following table differentiate between Intranet and Internet.

| Sr. No. | Feature       | Intranet   | Internet                                       |
|---------|---------------|--|--|
| 1.      | Accessibility | Private (restricted to authorized users).                | Public (accessible to anyone).                 |
| 2.      | What is?      | A private network, within an Enterprise or Organization. | Worldwide/global system of connected networks. |
| 3.      | Purpose       | Internal communication.                                  | Global information sharing.                    |
| 4.      | Security      | Highly secure (Firewalls, VPNs).                         | Less secure.                                   |
| 5.      | User-base     | Limited to organization members.                         | Open to all.                                   |
| 6.      | Network       | Localized Network.                                       | Worldwide Network.                             |
| 7.      | Expensive     | More expensive.  | Less expensive.                                |
| 8.      | Content type  | Organization-specific resources.                         | Diverse global content.                        |
| 9.      | Reliability   | More reliability.  | Less reliability.                              |

| Internet  | Intranet   |
|---|--|
| Internet is used to connect different networks of computers simultaneously.                                     | Intranet is owned by private firms.  |
| On the internet, there are multiple users.  | On an intranet, there are limited users.   |
| Internet is unsafe.   | Intranet is safe.  |
| On the internet, there is more number of visitors.  | In the intranet, there is less number of visitors.   |
| Internet is a public network.   | Intranet is a private network.   |
| Anyone can access the Internet.   | In this, anyone can't access the Intranet.   |
| The Internet provides unlimited information.  | Intranet provides limited information.   |
| Using Social media on your phone or researching resources via Google.   | A company used to communicate internally with its employees and share information  |
| The Internet is a global network that connects millions of devices and computers worldwide.                     | An intranet is a private network that connects devices and computers within an organization.                             |
| It is open to everyone and allows access to public information, such as websites and online services.           | An intranet is only accessible to authorized users within the organization.  |
| It is used for communication, sharing of information, e-commerce, education, entertainment, and other purposes. | An intranet is primarily used for internal communication, collaboration, and information sharing within an organization. |

| Internet   | Intranet  |
|--|---|
| Users can access the Internet from any location with an Internet connection and a compatible device.   | Access to an intranet is restricted to authorized users within the organization and is typically limited to specific devices and locations. |
| Security measures, such as firewalls, encryption, and <a href="#">secure sockets layer (SSL) protocols</a> , are used to protect against threats like hacking, viruses, and malware. | Intranets employ similar security measures to protect against unauthorized access and ensure the privacy and integrity of shared data.      |
| The Internet is a public network that is not owned by any particular organization or group.  | Intranets are private networks that are owned and managed by the organization that uses them.   |
| Examples of Internet-based services include email, social media, search engines, and online shopping sites.  | Examples of intranet-based services include internal communications, knowledge management systems, and collaboration tools                  |

| Following table illustrates the difference between IPv4 and IPv6. |   |  |
|---|---|--|
| Parameters  | IPv4  | IPv6   |
| Address length  | IPv4 is a 32-bit address.   | IPv6 is a 128-bit address.   |
| Fields  | IPv4 is a numeric address that consists of 4 fields which are separated by dot (.).                                     | IPv6 is an alphanumeric address that consists of 8 fields, which are separated by colon (:). |
| Classes   | IPv4 has five different classes of IP address that includes Class A, Class B, Class C, Class D, and Class E.            | IPv6 does not contain classes of IP addresses.   |
| Number of IP address  | IPv4 has a limited number of IP addresses.  | IPv6 has a large number of IP addresses.   |
| VLSM  | It supports VLSM (Virtual Length Subnet Mask (means that IPv4 converts IP addresses into a subnet of different sizes)). | It does not support VLSM.  |
| Address configuration   | It supports manual and DHCP configuration.  | It supports manual, DHCP, auto-configuration and renumbering.                                |
| Address space   | It generates 4 billion unique addresses   | It generates 340 undecillion unique addresses.   |
| End-to-end connection integrity                                   | In IPv4, end-to-end connection integrity is unachievable.   | In the case of IPv6, end-to-end connection integrity is achievable.                          |
| Security features   | In IPv4, security depends on the application.   | In IPv6, IPSEC is developed for security purposes.   |
| Address representation  | In IPv4, the IP address is represented in decimal.  | In IPv6, the representation of the IP address in hexadecimal.                                |
| Fragmentation   | Fragmentation is done by the senders and the forwarding routers.  | Fragmentation is done by the senders only.   |
| Packet flow identification  | It does not provide any mechanism for packet flow identification.   | It uses flow label field in the header for the packet flow identification.                   |
| Checksum field  | The checksum field is available in IPv4.  | The checksum field is not available in IPv6.   |
| Transmission scheme   | IPv4 is broadcasting.   | IPv6 is multicasting, which provides efficient network operations.                           |

Contd...

| 1.21 Internet Architecture and Network Layer |  |  |
|--|--|--|
| Encryption and Authentication                | It does not provide encryption and authentication.   | It provides encryption and authentication.   |
| Number of octets                             | It consists of 4 octets.   | It consists of 8 fields, and each field contains 2 octets.   |
| Use in Industry                              | Many companies have historically used and continue to use IPv4, including major tech companies like Apple, Microsoft, and Google, as well as other organizations like Ford Motor Company and AT&T. | These addresses are used by Comcast, Reliance Jio, T-Mobile USA, Sky broadband, Claro, Softbank, Orange, SK telecom, Cox communication, Kabel Deutschland and many more. |

Table 1.11.1 : Comparison between IPv4 and IPv6

| Sr. No. | IPv4   | IPv6  |
|---------|--|---|
| 1.      | In IPv4 there are only $2^{32}$ possible ways to represent the address (about 4 billion possible addresses)  | In IPv6 there are $2^{128}$ possible way (about $3.4 \times 10^{38}$ possible addresses)  |
| 2.      | The IPv4 address is written by dotted-decimal notation, e.g. 121.2.8.12  | IPv6 is written in hexadecimal and consists of 8 groups, containing 4 hexadecimal digits or 8 groups of 16 bits each, e.g. FABC: AC77: 7834:2222:FACB: AB98: 5432:4567.       |
| 3.      | The basic length of the IPv4 header comprises a minimum of 20 bytes (without option fields). The maximum total length of the IPv4 header is 60 bytes (with option fields), and it uses 13 fields to identify various control settings. | The IPv6 header is a fixed header of 40 bytes in length, and has only 8 fields. Option information is carried by the extension header, which is placed after the IPv6 header. |
| 4.      | IPv4 header has a checksum, which must be computed by each router  | IPv6 has no header checksum because checksums are, for example, above the TCP/IP protocol suite, and above the Token Ring, Ethernet, etc.                                     |
| 5.      | IPv4 contains an 8-bit field called Service Type. The Service Type field is composed of a TOS (Type of Service) field and a procedure field.   | The IPv6 header contains an 8-bit field called the Traffic Class Field. This field allows the traffic source to identify the desired delivery priority of its packets         |
| 6.      | The IPv4 node has only Stateful auto-configuration.  | The IPv6 node has both a stateful and a stateless address autoconfiguration mechanism.  |
| 7.      | Security in IPv4 networks is limited to tunneling between two networks   | IPv6 has been designed to satisfy the growing and expanded need for network security.   |
| 8.      | Source and destination addresses are 32 bits (4 bytes) in length.  | Source and destination addresses are 128 bits (16 bytes) in length.   |
| 9.      | IPsec support is optional.   | IPsec support is required.  |
| 10.     | No identification of packet flow for QoS handling by routers is present within the IPv4 header.  | Packet flow identification for QoS handling by routers is included in the IPv6 header using the Flow Label field.   |
| 11.     | Address Resolution Protocol (ARP) uses broadcast ARP Request frames to resolve an IPv4 address to a link layer address.  | ARP Request frames are replaced with multicast Neighbour Solicitation messages.   |
| 12.     | Must be configured either manually or through DHCP.  | Does not require manual configuration or DHCP.  |
| 13.     | ICMP Router Discovery is used to determine the IPv4 address of the best default gateway and is optional  | ICMP Router Discovery is replaced with ICMPv6 Router Solicitation and Router Advertisement messages and is required.  |
| 14.     | Header includes options  | All optional data is moved to IPv6 extension headers.   |

TechKnowledge  
Publications

| Feature              | IPv4   | IPv6  |
|----------------------|--|---|
| Address Length       | 32-bit address   | 128-bit address                                     |
| Address Format       | Decimal format (e.g., 192.168.0.1)                     | Hexadecimal format (e.g., 2001:0db8::1)             |
| Configuration        | Manual and DHCP configuration                          | Auto-configuration and renumbering supported        |
| Connection Integrity | End-to-end integrity is unachievable                   | End-to-end integrity is achievable                  |
| Security             | No built-in security; external tools like IPSec needed | IPSec is built-in for encryption and authentication |
| Fragmentation        | Performed by sender and routers                        | Performed only by the sender                        |

| Feature             | IPv4  | IPv6   |
|---------------------|---|--|
| Flow Identification | Not available                               | Uses Flow Label field in header for packet flow identification |
| Checksum Field      | Present                                     | Not present  |
| Transmission Scheme | Supports broadcast                          | Uses multicast and anycast; no broadcast                       |
| Header Size         | Variable: 20–60 bytes                       | Fixed: 40 bytes  |
| Conversion          | Can be converted to IPv6                    | Not all IPv6 addresses can be converted to IPv4                |
| Field Structure     | 4 fields separated by dots (.)              | 8 fields separated by colons (:)                               |
| Address Classes     | Has address classes (A, B, C, D, E)         | No concept of address classes                                  |
| VLSM Support        | Supports Variable Length Subnet Mask (VLSM) | Does not support VLSM  |
| Example             | 66.94.29.13                                 | 2001:0000:3238:DFE1:0063:0000:0000:FEFB                        |

| COMPARISON OF ARP and RARP: |                    |   |  |
|-----------------------------|--------------------|---|--|
| Sr. No.                     | Parameters         | ARP (Address Resolution Protocol)   | RARP (Reverse Address Resolution Protocol)   |
| 1.                          | Purpose            | Resolves IP addresses to MAC addresses.   | Resolves MAC addresses to IP addresses.  |
| 2.                          | Functionality      | Maps IP addresses to MAC addresses for communication.   | Maps MAC addresses to IP addresses for address assignment.   |
| 3.                          | Usage              | Used by devices to find the MAC address of a device with a known IP address.  | Used by diskless or IP-less devices to determine their IP address.                                     |
| 4.                          | Message Type       | ARP Request and ARP Reply messages.   | RARP Request and RARP Reply messages.  |
| 5.                          | Resolution Process | Device sends ARP Request to find the MAC address associated with a known IP address.  | Device sends RARP Request to find the IP address associated with a known MAC address.                  |
| 6.                          | Request Type       | Broadcast message requesting the MAC address for a specific IP address.   | Broadcast message requesting the IP address for a specific MAC address.                                |
| 7.                          | Response Type      | Unicast message providing the MAC address corresponding to the requested IP address.  | Unicast message providing the IP address corresponding to the requested MAC address.                   |
| 8.                          | Packet Format      | ARP packets have fields for hardware type, protocol type, hardware address length, protocol address length, operation code, sender hardware address, sender protocol address, target hardware address, and target protocol address. | RARP packets have similar fields as ARP packets.   |
| 9.                          | Usage Status       | Widely used in modern networks.   | Largely replaced by DHCP (Dynamic Host Configuration Protocol) for IP address assignment.              |
| 10.                         | Encapsulation      | ARP messages are encapsulated within Ethernet frames or other suitable link-layer protocols.  | RARP messages are encapsulated within Ethernet frames or other link-layer protocols.                   |
| 11.                         | Common Use Case    | Resolving IP addresses to MAC addresses in Ethernet-based networks.   | Assigning IP addresses to diskless workstations or devices without statically configured IP addresses. |

| ARP   | RARP  |
|---|---|
| A protocol used to map an IP address to a physical address                      | A protocol used to map a physical address to an IP address                      |
| To obtain the MAC address of a network device when only its IP address is known | To obtain the IP address of a network device when only its MAC address is known |
| IP addresses  | MAC addresses   |
| <a href="#">ARP</a> stands for Address Resolution Protocol.                     | Whereas <a href="#">RARP</a> stands for Reverse Address Resolution Protocol.    |
| In ARP, broadcast MAC address is used.  | While in RARP, broadcast IP address is used.                                    |
| In ARP, ARP table is managed or maintained by <a href="#">local host</a> .      | While in RARP, RARP table is managed or maintained by RARP server.              |
| In Address Resolution Protocol, Receiver's MAC address is fetched.              | While in RARP, IP address is fetched.   |
| ARP is used in sender's side to map the receiver's MAC address.                 | RARP is used in receiver's side to map the sender's IP.                         |

**Table 1.15.1 : Difference between RARP and ARP**

| Sr. No | RARP  | ARP   |
|--------|---|---|
| 1.     | A protocol used to map a physical (MAC) address to an IP address  | A protocol used to map an IP address to a physical (MAC) address  |
| 2.     | To obtain the IP address of a network device when only its MAC address is known   | To obtain the MAC address of a network device when only its IP address is known   |
| 3.     | Client broadcasts its MAC address and requests an IP address, and the server responds with the corresponding IP address | Client broadcasts its IP address and requests a MAC address, and the server responds with the corresponding MAC address |
| 4.     | MAC addresses   | IP addresses  |
| 5.     | Rarely used in modern networks as most devices have a pre-assigned IP address   | Widely used in modern networks to resolve IP addresses to MAC addresses   |
| 6.     | RFC 903 Standardization   | RFC 826 Standardization   |
| 7.     | RARP stands for Reverse Address Resolution Protocol   | ARP stands for Address Resolution Protocol  |
| 8.     | In RARP, we find our own IP address   | In ARP, we find the IP address of a remote machine  |
| 9.     | The MAC address is known and the IP address is requested  | The IP address is known, and the MAC address is being requested   |
| 10.    | It uses the value 3 for requests and 4 for responses  | It uses the value 1 for requests and 2 for responses  |

RARP has now become an obsolete protocol since it

| Subnetting  | Supernetting  |
|---|---|
| <u>Subnetting</u> is the procedure to divide the network into sub-networks. | While <u>supernetting</u> is the procedure of combining small networks. |
| In subnetting, Network addresses' bits are increased.                       | While in supernetting, Host addresses' bits are increased.              |
| In subnetting, The mask bits are moved towards the right.                   | While In supernetting, The mask bits are moved towards the left.        |
| Subnetting is implemented via Variable-length subnet masking.               | While supernetting is implemented via Classless interdomain routing.    |
| In subnetting, Address depletion is reduced or removed.                     | While It is used for simplifying the routing process.                   |

## UNIT 2

used in exterior routing.

### Difference between Intra-Domain and Inter-Domain Routing:

| Sr. No. | Intra-Domain Routing   | Inter-Domain Routing   |
|---------|--|--|
| 1.      | Routing takes place within an autonomous network.  | Routing takes place between the two autonomous networks.   |
| 2.      | This protocol ignores the internet outside the autonomous system.  | This protocol assumes that internet consists of a collection of interconnected autonomous systems.                           |
| 3.      | Protocols for Intra-domain routing are called as interior gateway protocols.   | Protocol for Inter-domain routing are also called as exterior gateway protocols.   |
| 4.      | For a packet that enters a domain, intra-domain routing will determine the route via which the packet will travel through to the border router connected to the next domain. | Inter-domain routing is the top-level routing. It determines the AS path each packet will travel through to its destination. |
| 5.      | Intra-domain multicast routing protocols, by which packets are multicast within a domain.  | Inter-domain routing protocols, by which packets multicast among domains.  |
| 6.      | In Interdomain Routing, Interior-gateway protocols such as RIP (resource information protocol) and OSPF (open shortest path first) are being used.                           | In Intradomain Routing, additional exterior-gateway protocols such as BGP (Border Gateway Protocol) are used.                |
| 7.      | Interdomain Routing, as name suggests, is the protocol in which the Routing algorithm works within and in between the domains.   | Intradomain Routing is a protocol in which the Routing algorithm works only within the domains.                              |

| Intradomain Routing | Interdomain Routing  |
|---------------------|--|
| 1.                  | Routing algorithm works only within domains.                                   |
| 2.                  | It need to know only about other routers within their domain.                  |
| 3.                  | Protocols used in intradomain routing are known as Interior-gateway protocols. |
| 4.                  | In this Routing, routing takes place within an autonomous network.             |
|                     | Routing algorithm works within and between domains.                            |
|                     | It need to know only about other routers within and between their domain.      |
|                     | Protocols used in interdomain routing are known as Exterior-gateway protocols. |
|                     | In this Routing, routing takes place between the autonomous networks.          |

|    |  |  |
|----|--|--|
| 5. | Intradomain routing protocols ignores the internet outside the AS(autonomous system).                            | Interdomain routing protocol assumes that the internet contains the collection of interconnected AS(autonomous systems). |
| 6. | Some Popular Protocols of this routing are RIP(routing information protocol) and OSPF(open shortest path first). | Popular Protocols of this routing is BGP(Border Gateway Protocol) used to connect two or more AS(autonomous system).     |

**Difference between RIPv1 and RIPv2:**

| Sr. No. | RIPv1  | RIPv2  |
|---------|--|--|
| 1.      | It uses broadcast for routing update.                      | It uses multicast for routing update.            |
| 2.      | It sends broadcast on 255.255.255.255 destination.         | It sends multicast on 224.0.0.9 destination.     |
| 3.      | It does not support VLSM (Variable Length Subnet Masking). | It supports VLSM.                                |
| 4.      | It does not support any authentication.                    | It supports MD5 authentication.                  |
| 5.      | It only supports classful routing.                         | It supports both classful and classless routing. |

**Advance Computer Network**

2.19

**Routing Protocols**

|     |   |   |
|-----|---|---|
| 6.  | It does not support discontinuous network.                | It supports discontinuous network.  |
| 7.  | RIP v1 uses what is known as classful routing.            | RIP v2 is a classless protocol and it supports variable-length subnet masking (VLSM), CIDR, and route summarization.                |
| 8.  | RIPv1 routing updates are broadcasted.                    | RIP v2 routing updates are multicasted.   |
| 9.  | RIP v1 does not carry mask in updates.                    | RIP v2 does carry mask in updates, so it supports for VLSM.   |
| 10. | RIP v1 is an older, no longer much used routing protocol. | IP v2 can be useful in small, flat networks or at the edge of larger networks because of its simplicity in configuration and usage. |

**RIPv1    RIPv2**

|    |   |   |
|----|---|---|
| 1. | RIPv1 is a Distance-Vector Routing protocol.                      | RIPv2 is also Distance-Vector Routing Protocol.             |
| 2. | The standard used RFC 1058.                                       | The standard used RFC 1721,1722 and 2453.                   |
| 3. | It can supports class full network only.                          | It can support class full and classless networks.           |
| 4. | It does not support for authentications.                          | It support for authentications.                             |
| 5. | It hop count limit is 15.   | It hop count limit is 15.                                   |
| 6. | It does not support for VLSM and discontinuous networks.          | It supports for VLSM and discontinuous networks.            |
| 7. | It is less secure.  | It is more secure.  |
| 8. | RIPv1 uses Broadcast traffic for updates.                         | RIPv2 uses Multicast traffic for updates.                   |
| 9. | The routing update address used for Broadcast is 255.255.255.255. | The routing update address used for Multicast is 224.0.0.9. |

| RIPv1 | RIPv2   |   |
|-------|---|---|
| 10.   | RIPv1 does not provide trigger updates.                       | RIPv2 provides trigger updates.                       |
| 11.   | RIPv1 does not send a subnet mask to the routing table.       | RIPv2 sends subnet mask to the routing table.         |
| 12.   | RIPv1 doesn't support manual route summarization.             | RIPv2 supports manual route summarization.            |
| 13.   | RIPv1 does not support Classless Inter-Domain Routing (CIDR). | RIPv1 supports Classless Inter-Domain Routing (CIDR). |

| Table 2.12.1 : Comparison between RIP and OSPF |                         |   |   |   |
|--|-------------------------|---|---|---|
| Sr. No.  | Function/Feature        | RIPv1   | RIPv2   | OSPF                                      |
| 1.   | Standard number         | RFC 1058  | RFC 1723  | RFC 2178                                  |
| 2.   | Link-state protocol     | No  | No  | Yes                                       |
| 3.   | Large range of metrics  | Hop count (16=Infinity)                               | Hop count (16=Infinity)                               | Yes, based on 1-65535                     |
| 4.   | Update policy           | Route table every 30 seconds                          | Route table every 30 seconds                          | Link-state changes, or every 30 [minutes] |
| 5.   | Update address          | Broadcast   | Broadcast, multicast                                  | Multicast                                 |
| 6.   | Dead interval           | 300 seconds total                                     | 300 seconds total                                     | 300 seconds total, but usually much less  |
| 7.   | Supports authentication | No  | Yes   | Yes                                       |
| 8.   | Convergence time        | Variable (based on number of routers X dead interval) | Variable (based on number of routers X dead interval) | Media delay + dead interval               |

## Advance Computer Network

| Sr. No. | Function/Feature        | RIPv1   | RIPv2   | OSPF           |
|---------|-------------------------|---------|---------|----------------|
| 9.      | Variable-length subnets | No      | Yes     | Yes            |
| 10      | Supports supernetting   | No      | Yes     | Yes            |
| 11      | Type of Service (TOS)   | No      | No      | Yes            |
| 12      | Multipath routing       | No      | No      | Yes            |
| 13      | Network diameter        | 15 hops | 15 hops | 65535 possible |
| 14      | Easy to use             | Yes     | Yes     | No             |

|   |   |
|---|---|
| RIP   | OSPF  |
| RIP Stands for Routing Information Protocol.  | OSPF stands for Open Shortest Path First.   |
| RIP works on the <a href="#">Bellman-Ford algorithm</a> .   | OSPF works on <a href="#">Dijkstra algorithm</a> .  |
| It is a Distance Vector protocol and it uses the distance or hops count to determine the transmission path. | It is a link-state protocol and it analyzes different sources like the speed, cost and path congestion while identifying the shortest path. |
| It is used for smaller size organizations.  | It is used for larger size organizations in the network.  |
| It allows a maximum of 15 hops.   | There is no such restriction on the hop count.  |
| It is not a more intelligent dynamic routing protocol.  | It is a more intelligent routing protocol than RIP.   |
| The networks are classified as areas and tables here.   | The networks are classified as areas, sub-areas, autonomous systems, and backbone areas here.   |
| Its administrative distance is 120.   | Its administrative distance is 110.   |

|   |  |
|---|--|
| RIP   | OSPF   |
| RIP uses <a href="#">UDP(User Datagram Protocol)</a> Protocol.  | OSPF works for <a href="#">IP(Internet Protocol)</a> Protocol.                       |
| It calculates the metric in terms of Hop Count.   | It calculates the metric in terms of bandwidth.                                      |
| In RIP, the whole routing table is to be broadcasted to the neighbors every 30 seconds by the routers.          | In OSPF, parts of the routing table are only sent when a change has been made to it. |
| RIP utilizes less memory compared to OSPF but is CPU intensive like OSPF.                                       | OSPF device resource requirements are CPU intensive and memory.                      |
| It consumes more bandwidth because of greater network resource requirements in sending the whole routing table. | It consumes less bandwidth as only part of the routing table is to send.             |
| Its multicast address is 224.0.0.9.   | OSPF's multicast addresses are 224.0.0.5 and 224.0.0.6.                              |

**Difference between Distance Vector Routing and Link State Routing:**

| Sr. No. | Distance Vector Routing  | Link State Routing  |
|---------|--|---|
| 1.      | The distance vector routing determines the direction (vector) and distance (such as link cost or number of hops) to any link in the network.                   | The link state routing uses the Shortest Path First (SPF) algorithm to create an abstract of the exact topology of the entire network.        |
| 2.      | Distance vector routing protocols do not have an actual map of the network topology.   | A link state routing protocol is like having a complete map of the network topology.  |
| 3.      | The distance vector routing algorithm is a type of routing algorithm that is based on the number of hops in a route between a source and destination computer. | The link state routing algorithm broadcasts information about the cost of reaching each of its neighbors to all other routers in the network. |
| 4.      | Uses Bellman-Ford algorithm.   | Uses Dijkstra's algorithm.  |

Contd...

| Advance Computer Network |  | 2.24   | Routing Protocols |
|--------------------------|--|--|-------------------|
| 5.                       | The name 'distance vector' is used because the routers exchange vectors containing distance and direction information. | In link state routing, each routing node makes a connectivity graph for the nodes in the network and independently calculates its shortest path to every other destination in the network. |                   |
| 6.                       | Less bandwidth is required.  | High bandwidth is required.  |                   |
| 7.                       | Distance vector routing updates full routing table.  | Link state routing updates only the link state.  |                   |
| 8.                       | Example of distance vector routing protocols is RIP.   | Example of link state routing protocols is OSPF.   |                   |
| 9.                       | The utilization of CPU and memory in distance vector routing is lower than the link state routing.                     | Higher utilization of CPU and memory.  |                   |
| 10.                      | Distance vector routing does not have any hierarchical design.   | Link state routing works best for hierarchical routing design and in networks where fast convergence is crucial.   |                   |

| Distance Vector Routing  | Link State Routing  |
|--|---|
| Bandwidth required is less due to local sharing, small packets and no flooding.        | Bandwidth required is more due to flooding and sending of large link state packets. |
| Based on local knowledge, since it updates table based on information from neighbours. | Based on global knowledge, it have knowledge about entire network.                  |

| Distance Vector Routing   | Link State Routing  |
|---|---|
| Make use of <a href="#">Bellman Ford Algorithm</a> .                        | Make use of <a href="#">Dijkstra's algorithm</a> .                          |
| Traffic is less.  | Traffic is more.  |
| Converges slowly i.e, good news spread fast and bad news spread slowly.     | Converges faster.   |
| <a href="#">Count of infinity problem</a> .                                 | No count of infinity problem.   |
| <a href="#">Persistent looping problem</a> i.e, loop will be there forever. | No persistent loops, only transient loops.                                  |
| Practical implementation is <a href="#">RIP</a> and <a href="#">IGRP</a> .  | Practical implementation is <a href="#">OSPF</a> and <a href="#">ISIS</a> . |

**Comparison between RIP and OSPF:**

| Sr. No. | RIP   | OSPF   |
|---------|---|--|
| 1.      | RIP is a distance vector routing protocol that has two versions namely, RIPv1 and RIPv2.                                | OSPF is a link state routing protocol.   |
| 2.      | RIP is easy to configure.   | OSPF is complicated to configure and Requires network design and planning.                       |
| 3.      | RIP networks cannot grow larger than 15 hops.   | OSPF networks are technically unlimited in size.   |
| 4.      | An end system (a system with only one network interface) can run RIP in passive mode to listen for routing information. | OSPF does not have a passive mode.   |
| 5.      | RIP uses much more bandwidth because of its distance vector behavior.   | OSPF requires lower bandwidth than RIP.  |
| 6.      | In RIP, the networks are classified as areas and tables.  | In OSPF, the networks are classified as areas, sub areas, autonomous systems and backbone areas. |
| 7.      | RIP may be slow to adjust for link failures.  | OSPF is quick to adjust for link failures.   |
| 8.      | The RIP routing protocol uses the distance vector algorithm.  | OSPF uses the shortest path algorithm Dijkstra to determine the transmission routes.             |
| 9.      | RIP generates more protocol traffic than OSPF.  | OSPF generates less protocol traffic than RIP.   |
| 10.     | RIP is simpler routing protocol.  | OSPF is much more complex protocol.  |
| 11.     | RIP is not well suited to large networks, because RIP packet size increases as the number of networks increases.        | OSPF works well in large networks.   |

**Ans. The following table differentiate between Static Routing and Dynamic Routing.**

| Sr. No. | Parameters     | Static Routing   | Dynamic Routing   |
|---------|----------------|--|---|
| 1.      | Routing        | In static routing, user-defined routes are used in the routing table.  | In dynamic routing, routes are updated as per the changes in network.   |
| 2.      | Scalability    | Limited.   | High.   |
| 3.      | Protocols used | Static routing may not follow any specific protocol. Static routing involves manually configuring routes on network devices. | Dynamic routing uses protocols (like OSPF, RIP, EIGRP) that enable routers to communicate and automatically adjust routes in response to network changes. |
| 4.      | Security       | Higher security  | Less security.  |
| 5.      | Automation     | Static routing is a manual process.  | Dynamic routing is an automatic process.  |

5. Explain any three Intra-domain routing protocols.

| Static Routing   | Dynamic Routing   |
|--|---|
| In static routing routes are user-defined.                     | In dynamic routing, routes are updated according to the topology.         |
| Static routing does not use complex routing algorithms.        | Dynamic routing uses complex routing algorithms.                          |
| Static routing provides high or more security.                 | Dynamic routing provides less security.                                   |
| Static routing is manual.                                      | Dynamic routing is automated.   |
| Static routing is implemented in small networks.               | Dynamic routing is implemented in large networks.                         |
| In static routing, additional resources are not required.      | In dynamic routing, additional resources are required.                    |
| In static routing, failure of the link disrupts the rerouting. | In dynamic routing, failure of the link does not interrupt the rerouting. |
| Less <u>Bandwidth</u> is required in Static Routing.           | More Bandwidth is required in Dynamic Routing.                            |
| Static Routing is difficult to configure.                      | Dynamic Routing is easy to configure.                                     |
| Another name for static routing is non-adaptive routing.       | Another name for dynamic routing is adaptive routing.                     |

| Sr. No. | Distance vector routing  | Link state routing   |
|---------|--|--|
| 1.      | Each router maintains routing table indexed by and containing one entry for each router in the subnet. | It is the advanced version of distance vector routing                  |
| 2.      | Algorithm took too long to converge.   | Algorithm is faster.   |
| 3.      | Bandwidth is less.   | Wide bandwidth is available.   |
| 4.      | Router measure delay directly with special ECHO packets.   | All delays measured and distributed to every router.                   |
| 5.      | It doesn't take line bandwidth into account when choosing the routes.                                  | It considers the line bandwidth into account when choosing the routes. |

**Table 2.7.2 : Comparison of static and dynamic routing**

| Sr. No. | Parameter                      | Static routing                                   | Dynamic routing                     |
|---------|--------------------------------|--|-------------------------------------|
| 1.      | Updating of the routing tables | Manually done                                    | Automatically done                  |
| 2.      | Bandwidth requirement          | Less   | More                                |
| 3.      | Application area               | In small networks                                | In large networks                   |
| 4.      | Routing protocols              | None   | EIGRP, ARP etc.                     |
| 5.      | Security                       | Highly secure                                    | Less secure                         |
| 6.      | Routing algorithms             | Shortest path, flooding, flow based routing      | Distance vector, link state         |
| 7.      | Link failure                   | Any link failure affects the other routing paths | Does not affect other routing paths |
| 8.      | Additional resources           | Not required                                     | Required to store information       |

| Sr. No. | Parameter         | Static routing   | Dynamic routing                                |
|---------|-------------------|--|--|
| 9.      | Routing decision  | Not based on the measured or estimated current traffic | Is based on the changes in topology or traffic |
| 10.     | Configuration     | Difficult to configure                                 | Easy to configure                              |
| 11.     | Security          | Highly secure  | Less secure                                    |
| 12.     | Routing protocols | None   | EIGRP, ARP etc.                                |
| 13.     | Cost              | Less   | More   |

**Table 3.2.1 : Comparison of CLTS & COTS**

| <b>Sr. No.</b> | <b>Parameter</b>                     | <b>Connection oriented</b>         | <b>Connectionless</b>                         |
|----------------|--------------------------------------|------------------------------------|---|
| 1.             | <b>Reservation of resources</b>      | Necessary                          | Not necessary                                 |
| 2.             | <b>Utilization of resources</b>      | Less                               | Good  |
| 3.             | <b>State information</b>             | Lot of information required        | Not much information is required to be stored |
| 4.             | <b>Guarantee of service</b>          | Guaranteed                         | No guarantee                                  |
| 5.             | <b>Connection</b>                    | Connection needs to be established | Connection need not be established            |
| 6.             | <b>Delays</b>                        | More                               | Less  |
| 7.             | <b>Overheads</b>                     | Less                               | More  |
| 8.             | <b>Packets travel</b>                | Sequentially                       | Randomly                                      |
| 9.             | <b>Congestion due to overloading</b> | Not possible                       | Very much possible                            |

| Connection-oriented Service  | Connection-less Service   |
|--|---|
| <u>Connection-oriented</u> service is related to the telephone system.     | <u>Connection-less</u> service is related to the postal system.   |
| Connection-oriented service is preferred by long and steady communication. | Connection-less Service is preferred by bursty communication.     |
| Connection-oriented Service is necessary.                                  | Connection-less Service is not compulsory.                        |
| Connection-oriented Service is feasible.                                   | Connection-less Service is not feasible.                          |
| In connection-oriented Service, Congestion is not possible.                | In connection-less Service, Congestion is possible.               |
| Connection-oriented Service gives the guarantee of reliability.            | Connection-less Service does not give a guarantee of reliability. |
| Includes error detection, correction, and retransmission.                  | No error handling; errors are not corrected.                      |
| In connection-oriented Service, Packets follow the same route.             | In connection-less Service, Packets do not follow the same route. |
| Ensures data is delivered in the correct order.                            | Data may arrive out of order or not at all.                       |
| Less scalable due to the need for maintaining connections.                 | Highly scalable for large networks with many users.               |
| Higher overhead due to connection setup and maintenance.                   | Lower overhead as no connection is required.                      |

|   |  |
|---|--|
| Connection-oriented Service                                       | Connection-less Service                                    |
| Connection-oriented services require a bandwidth of a high range. | Connection-less Service requires a bandwidth of low range. |
| Ex: <a href="#">TCP (Transmission Control Protocol)</a>           | Ex: <a href="#">UDP (User Datagram Protocol)</a>           |
| Connection-oriented requires authentication.                      | Connection-less Service does not require authentication.   |

**Table 3.14.1 : Comparison of UDP and TCP**

| Sr. No. | Characteristic / Description           | UDP   | TCP  |
|---------|--|---|--|
| 1.      | <b>General Description</b>             | Simple, high-speed, low-functionality "wrapper" that interfaces applications to the network layer and does little else. | Full-featured protocol that allows applications to send data reliably without worrying about network layer issues. |
| 2.      | <b>Protocol Connection Setup</b>       | Connectionless; data is sent without setup.   | Connection-oriented; connection must be established prior to transmission.   |
| 3.      | <b>Data Interface To Application</b>   | Message-based; data is sent in discrete packages by the application.  | Stream-based; data is sent by the application with no particular structure.  |
| 4.      | <b>Reliability and Acknowledgments</b> | Unreliable, best-effort delivery without acknowledgments  | Reliable delivery of messages; all data is acknowledged.   |

| Transport Layer Protocols |   |   |  |
|---------------------------|---|---|--|
| Sr. No.                   | Characteristic / Description                | UDP   | TCP  |
| 5.                        | Retransmissions                             | Not performed. Application must detect lost data and retransmit if needed.  | Delivery of all data is managed, and lost data is retransmitted automatically.   |
| 6.                        | Features Provided to Manage Flow of Data    | None  | Flow control using sliding windows; window size adjustment heuristics; congestion avoidance algorithms.                          |
| 7.                        | Overhead                                    | Very low  | Low, but higher than UDP   |
| 8.                        | Transmission Speed                          | Very high   | High, but not as high as UDP   |
| 9.                        | Data Quantity Suitability                   | Small to moderate amounts of data (up to a few hundred bytes)   | Small to very large amounts of data (up to gigabytes)  |
| 10.                       | Types of Applications That Use The Protocol | Applications where data delivery speed matters more than completeness, where small amounts of data are sent; or where multicast/broadcast are used. | Most protocols and applications sending data that must be received reliably, including most file and message transfer protocols. |
| 11.                       | Well-Known Applications and Protocols       | Multimedia applications, DNS, BOOTP, DHCP, TFTP, SNMP, RIP, NFS (early versions).   | FTP, Telnet, SMTP, DNS, HTTP, POP, NNTP, IMAP, BGP, IRC, NFS (later versions).   |
| 12.                       | Error control                               | Only checksum.  | Provided.  |

Table 3.19.1 : Comparison between TCP, UDP and SCTP

| Sr. No. | Parameter               | TCP                 | UDP              | SCTP                |
|---------|-------------------------|---------------------|------------------|---------------------|
| 1.      | Reliability             | Reliable            | Unreliable       | Reliable            |
| 2.      | Connection management   | Connection oriented | Connectionless   | Connection oriented |
| 3.      | Transmission of message | Byte oriented       | Message oriented | Message oriented    |
| 4.      | Flow control            | Yes                 | No               | Yes                 |
| 5.      | Security                | Yes                 | Yes              | Improved            |
| 6.      | Data delivery           | Strictly ordered    | Unordered        | Partially ordered   |

Is. Following table compare TCP and UDP:

| Sr. No. | Characteristics               | TCP   | UDP  |
|---------|-------------------------------|---|--|
| 1.      | Connection                    | TCP is connection oriented Protocol.  | UDP is connection less protocol.                                   |
| 2.      | Reliability                   | It provides reliable delivery of messages.  | It provides unreliable delivery of messages.                       |
| 3.      | Error Handling                | TCP makes checks for errors and reporting.  | UDP does error checking but no reporting.                          |
| 4.      | Flow controlling              | TCP has flow control.   | UDP has no flow control.   |
| 5.      | Data transmission order       | TCP gives guarantee that the order of the data at the receiving end is the same as the sending end. | No guarantee of the data transmission order.                       |
| 6.      | Header Size                   | 20 bytes.   | 8 bytes.   |
| 7.      | Acknowledgment                | TCP acknowledges the data reception.  | UDP has no acknowledgment Section.                                 |
| 8.      | Use                           | Used where reliability is important.  | Used where time sensitivity is more important.                     |
| 9.      | Data Interface to application | Stream-based: No particular structure for data.   | Message based data: Data sent in discrete packages by application. |
| 10.     | Overhead                      | Low.  | Very low.  |
| 11.     | Speed                         | High.   | Very high.   |
| 12.     | Application                   | FTP, Telnet, SMTP, DNS, HTTP.   | DNS, BOOTP, DHCP, TFTP, RIP.                                       |

Contd...

| Basis                    | Transmission Control Protocol (TCP)   | User Datagram Protocol (UDP)  |
|--------------------------|---|---|
| Type of Service          | <u>TCP</u> is a connection-oriented protocol. Connection orientation means that the communicating devices should establish a connection before transmitting data and should close the connection after transmitting the data. | <u>UDP</u> is the Datagram-oriented protocol. This is because there is no overhead for opening a connection, maintaining a connection, or terminating a connection. UDP is efficient for broadcast and multicast types of network transmission. |
| Reliability              | TCP is reliable as it guarantees the delivery of data to the destination router.  | The delivery of data to the destination cannot be guaranteed in UDP.  |
| Error checking mechanism | TCP provides extensive <u>error-checking</u> mechanisms. It is because it provides flow control and acknowledgment of data.   | UDP has only the basic error-checking mechanism using <u>checksums</u> .  |
| Acknowledgment           | An acknowledgment segment is present.   | No acknowledgment segment.  |
| Sequence                 | Sequencing of data is a feature of Transmission Control Protocol (TCP). this means that packets arrive in order at the receiver.  | There is no sequencing of data in UDP. If the order is required, it has to be managed by the application layer.   |
| Speed                    | TCP is comparatively slower than UDP.   | UDP is faster, simpler, and more efficient than TCP.  |

| Basis                  | Transmission Control Protocol (TCP)   | User Datagram Protocol (UDP)  |
|------------------------|---|---|
| Retransmission         | Retransmission of lost packets is possible in TCP, but not in UDP.  | There is no retransmission of lost packets in the User Datagram Protocol (UDP).   |
| Header Length          | TCP has a (20-60) bytes variable length header.   | UDP has an 8 bytes fixed-length header.   |
| Weight                 | TCP is heavy-weight.  | UDP is lightweight.   |
| Handshaking Techniques | Uses handshakes such as SYN, ACK, SYN-ACK   | It's a connectionless protocol i.e. No handshake  |
| Broadcasting           | TCP doesn't support Broadcasting.   | UDP supports Broadcasting.  |
| Protocols              | TCP is used by <a href="#">HTTP</a> , <a href="#">HTTPs</a> , <a href="#">FTP</a> , <a href="#">SMTP</a> and <a href="#">Telnet</a> .   | UDP is used by <a href="#">DNS</a> , <a href="#">DHCP</a> , TFTP, <a href="#">SNMP</a> , <a href="#">RIP</a> , and <a href="#">VoIP</a> .   |
| Stream Type            | The TCP connection is a byte stream.  | UDP connection is a message stream.   |
| Overhead               | Low but higher than UDP.  | Very low.   |
| Applications           | This protocol is primarily utilized in situations when a safe and trustworthy communication procedure is necessary, such as in email, on the web surfing, and in military services. | This protocol is used in situations where quick communication is necessary but where dependability is not a concern, such as VoIP, game streaming, video, and music streaming, etc. |

| Protocol        | TCP (Transmission Control Protocol)   | UDP (User Datagram Protocol)                                       | SCTP (Stream Control Transmission Protocol)   |
|-----------------|---|--|---|
| Reliability     | Reliable data delivery with error detection, retransmission, and acknowledgement mechanisms | Unreliable data delivery without error recovery or acknowledgement | Reliable data delivery with error detection, retransmission, and acknowledgement mechanisms |
| Connection Type | Connection-oriented   | Connectionless   | Connection-oriented   |
| Ordering        | Guarantees ordered delivery of data packets   | Does not guarantee the ordered delivery of data packets            | Guarantees ordered delivery of data packets   |

| Protocol                  | TCP (Transmission Control Protocol)                                      | UDP (User Datagram Protocol)                                 | SCTP (Stream Control Transmission Protocol)                              |
|---------------------------|--|--|--|
| Speed                     | Slower due to reliability mechanisms                                     | Faster due to minimal overhead                               | Comparable to TCP, slower than UDP due to additional functionality       |
| Overhead                  | Higher overhead due to additional headers and control mechanisms         | Lower overhead due to minimal headers and control mechanisms | Moderate overhead due to additional headers and control mechanisms       |
| Applications              | Web browsing, email transfer, file transfer (FTP)                        | Real-time communication, video streaming, online gaming, DNS | Telecommunications, voice and video over IP, signalling transport        |
| Congestion Control        | Implements congestion control mechanisms to optimize network performance | No congestion control mechanisms                             | Implements congestion control mechanisms to optimize network performance |
| Error Recovery            | Detects and retransmits lost or corrupted packets                        | No error recovery mechanisms                                 | Detects and retransmits lost or corrupted packets                        |
| Message-Oriented Delivery | No   | No   | Yes, supports message-oriented delivery                                  |
| Multi-streaming           | No   | No   | Yes, supports the simultaneous transmission of multiple streams          |
| Multi-homing              | No   | No   | Yes, supports multiple IP addresses for fault tolerance and resilience   |

UNIT 4

| Sr. No. | Parameter      | SMTP                                | POP3  |
|---------|----------------|-------------------------------------|---|
| 1.      | Full form      | Simple mail transfer protocol       | Post office protocol version 3                            |
| 2.      | Function       | Used for sending email messages     | Used for receiving email messages                         |
| 3.      | Port number    | 25                                  | 110   |
| 4.      | Known as       | Push protocol                       | POP protocol  |
| 5.      | E-mail storage | Does not store emails on the server | Stores emails on the server until downloaded by the user. |

| Advanced Computer Network |                 |   |   | 4-1 |
|---------------------------|-----------------|---|---|-----|
| Sr. No.                   | Parameter       | SMTP  | POP3  |     |
| 6.                        | Connection type | Connection oriented                                     | Connection less                                       |     |
| 7.                        | Security        | Uses SSL / TLS encryption for secure email transmission | Uses SSL / TLS encryption for secure email retrieval. |     |
| 8.                        | Protocol used   | TCP   | TCP   |     |

|   |  |
|---|--|
| SMTP  | POP3   |
| SMTP stands for <a href="#">Simple Mail Transfer Protocol</a> .   | POP3 stands for <a href="#">Post Office Protocol</a> version 3.  |
| It is used for sending messages.  | It is used for accessing messages.   |
| The port number of SMTP is 25, 465, and 587 for secured connection (TLS connection).                              | The port number of POP3 is 110 or port 995 for SSL/TLS connection.   |
| It is an MTA (Message Transfer Agent) for sending the message to the receiver.                                    | It is MAA (Message Access Agent) for accessing the messages from mailbox.                                      |
| It has two MTAs one is client MTA (Message Transfer Agent) and second one is server MTA (Message Transfer Agent). | It has also two MAAs one is client MAA (Message Access Agent) and another is server MAA(Message Access Agent). |
| SMTP is also known as PUSH protocol.  | POP3 is also known as POP protocol.  |
| SMTP transfers the mail from sender's computer to the mail box present on receiver's mail server.                 | POP3 allows to retrieve and organize mails from mailbox on receiver mail server to receiver's computer.        |
| It is implied between sender mail server and receiver mail server.  | It is implied between receiver and receiver mail server.   |

Table 4.10.2 : Comparison of IMAP and POP3

| Sr. No. | Parameter                    | POP 3        | IMAP       |
|---------|------------------------------|--------------|------------|
| 1.      | Protocol is defined at       | RFC 1939     | RFC 2060   |
| 2.      | TCP port used                | 110          | 143        |
| 3.      | e-mail is stored at          | User's PC    | Server     |
| 4.      | e-mail is read               | Off line     | On line    |
| 5.      | Time required to connect     | Small        | Long       |
| 6.      | Use of server resources      | Minimal      | Extensive  |
| 7.      | Multiple mail boxes          | Not possible | Possible   |
| 8.      | Who backs up mailboxes       | User         | ISP        |
| 9.      | For mobile users             | Not good     | Good       |
| 10.     | User control over download   | Little       | Great      |
| 11.     | Partial message downloads    | No           | Yes        |
| 12.     | Simplicity in implementation | Yes          | No         |
| 13.     | Support                      | Wide spread  | Increasing |

| Post Office Protocol (POP3)  | Internet Message Access Protocol (IMAP)  |
|--|--|
| <a href="#">POP</a> is a simple protocol that only allows downloading messages from your Inbox to your local computer. | <a href="#">IMAP (Internet Message Access Protocol)</a> is much more advanced and allows the user to see all the folders on the mail server. |
| The POP server listens on port 110, and the POP with SSL secure(POP3DS) server listens on port 995                     | The IMAP server listens on port 143, and the IMAP with SSL secure(IMAPDS) server listens on port 993.  |
| In POP3 the mail can only be accessed from a single device at a time.  | Messages can be accessed across multiple devices   |
| To read the mail it has to be downloaded on the local system.  | The mail content can be read partially before downloading.   |
| The user can not organize mail in the mailbox of the mail server.  | On the mail server, the user can directly arrange the email.   |
| The user can not create, delete,e or rename email on the mail server.  | The user can create, delete,e or rename an email on the mail server.   |
| It is unidirectional i.e. all the changes made on a device do not affect the content present on the server.            | It is Bi-directional i.e. all the changes made on the server or device are made on the other side too.                                       |
| It does not allow a user to sync emails.   | It allows a user to sync their emails.   |

|   |   |
|---|---|
| Post Office Protocol (POP3)   | Internet Message Access Protocol (IMAP)   |
| It is fast.   | It is slower as compared to POP3.   |
| A user can not search the content of mail before downloading it to the local system.  | A user can search the content of mail for a specific string before downloading.   |
| <p>It has two modes: delete mode and keep mode.</p> <ul style="list-style-type: none"> <li>• In delete mode, the mail is deleted from the mailbox after retrieval.</li> <li>• In keep mode, the mail remains in the mailbox after retrieval.</li> </ul> | Multiple redundant copies of the message are kept at the mail server, in case of loss of message on a local server, the mail can still be retrieved |
| Changes in the mail can be done using local email software.   | Changes made to the web interface or email software stay in sync with the server.   |
| All the messages are downloaded at once.  | The Message header can be viewed before downloading.  |

**Table 4.15.1 : Comparison of HTTP and SMTP**

| Sr. No. | SMTP   | HTTP   |
|---------|--|--|
| 1.      | <b>Message is transferred from client to server.</b>       | <b>Message transfer is from client to server or the other way round.</b>                 |
| 2.      | <b>Uses TCP.</b>   | <b>Uses TCP.</b>   |
| 3.      | <b>Uses port 25 for transmission.</b>                      | <b>Uses port 80 for transmission.</b>  |
| 4.      | <b>SMTP messages are to be read by humans.</b>             | <b>HTTP messages are to be read and understood by the HTTP servers and HTTP clients.</b> |
| 5.      | <b>These messages are first stored and then forwarded.</b> | <b>These messages are immediately delivered.</b>   |

|  |   |
|--|---|
| SMTP   | HTTP  |
| SMTP is used for mail services.  | HTTP is mainly used for data and file transfer.   |
| It uses port 25.   | It uses port 80.  |
| It is primarily a push protocol.                                       | It is primarily a pull protocol.  |
| It imposes a 7-bit ASCII restriction on the content to be transferred. | It does not impose a 7-bit ASCII restriction. Can transfer multimedia, hyperlinks, etc. |

| SMTP  | HTTP   |
|---|--|
| SMTP transfers emails via Mail Servers.                                   | HTTP transfers files between the Web server and the Web client.            |
| SMTP is a persistent type of TCP connection.                              | It can use both Persistent and Non-persistent.                             |
| Uses base64 encoding for authentication.                                  | Uses different methods of authentication such as basic, digest, and OAuth. |
| Does not support session management or cookies.                           | Supports session management and cookies to maintain state.                 |
| Has a smaller message size limit compared to HTTP.                        | Has a larger message size limit compared to SMTP.                          |
| Requires authentication for sending emails.                               | Does not require authentication for browsing web pages.                    |
| Supports both plain text and encrypted communication (SMTPS or STARTTLS). | Supports both plain text and encrypted communication (HTTPS).              |

Fig. 4.32

**Difference between SMTP and POP3:**

| Sr. No. | SMTP   | POP3                                       |
|---------|--|--|
| 1.      | It is message transfer agent.  | It is message access agent.                |
| 2.      | Stands for Simple Mail Transfer Protocol.  | Stands for Post Office Protocol version 3. |
| 3.      | Between sender and sender mail server and between sender mail server and receiver mail server. | Between receiver and receiver mail server. |

4.27

Application Layer Protocols

Contd...

|    |  |   |
|----|--|---|
| 4. | <b>It transfers the mail from sender's computer to the mail box present on receiver's mail server.</b>       | It allows to retrieve and organize mails from mailbox on receiver mail server to receiver's computer. |
| 5. | <b>SMTP is an application layer protocol that is used to send e-mail from the client to the mail server.</b> | POP3 is an application layer protocol used by email systems to retrieve mail from e-mail servers.     |
| 6. | <b>SMTP is an Internet protocol for transmitting e-mail over IP networks.</b>                                | POP3 is an Internet protocol used to retrieve e-mail from a mail server POP3 access incoming mails.   |
| 7. | <b>It uses port 25 for transfer of all outgoing e-mail.</b>  | An e-mail client connects with a POP3 server via port 110.  |

**Comparison between POP and IMAP:**

| Sr. No. | POP  | IMAP   |
|---------|--|--|
| 1.      | Generally used to support single client.       | Designed to handle multiple clients.                                 |
| 2.      | Messages are accessed offline.                 | Messages are accessed online although it also supports offline mode. |
| 3.      | POP does not allow search facility.            | It offers ability to search e-mails.                                 |
| 4.      | All the messages have to be downloaded.        | It allows selective transfer of messages to the client.              |
| 5.      | Only one mailbox can be created on the server. | Multiple mailboxes can be created on the server.                     |
| 6.      | Not suitable for accessing non-mail data.      | Suitable for accessing non-mail data i.e., attachment.               |
| 7.      | It requires minimum use of server resources.   | Clients are totally dependent on server.                             |

Contd...

|    |   |   |
|----|---|---|
| 8. | POP requires less internet usage time.  | IMAP requires more internet usage time.   |
| 9. | POP is a stateful protocol until the mail is downloaded as well as stateless across sessions. | IMAP is a stateful protocol because the IMAP server has to maintain a folder hierarchy for each of its users. |

**Differences between FTP and TFTP:**

[S-22, S-23, W-24]

| Sr. No. | Parameters          | FTP   | TFTP  |
|---------|---------------------|---|---|
| 1.      | Stands for          | File Transfer Protocol.                         | Trivial File Transfer Protocol.                 |
| 2.      | Features            | Authentication, encryption, and error recovery. | Basic file transfer only.                       |
| 3.      | Protocol Complexity | More complex and heavier.                       | Less complex and lightweight.                   |
| 4.      | Ports used          | FTP works on ports 20 and 21.                   | TFTP works on port 69.                          |
| 5.      | Protocol used       | FTP is based on TCP.                            | TFTP is based on UDP.                           |
| 6.      | Authentication      | Authentication is must for FTP.                 | Authentication is not required in case of TFTP. |
| 7.      | Use Cases           | General file transfer, Web servers etc.         | Network device configuration, Booting etc.      |

**Difference between FTP and HTTP:**

| Sr. No. | FTP  | HTTP   |
|---------|--|--|
| 1.      | FTP is used to access and transfer files.  | HTTP is used to view websites.   |
| 2.      | FTP is efficient in transferring larger files.   | HTTP is efficient in transferring smaller files like web pages.  |
| 3.      | FTP can be accessed via the command line or graphical client of its own.   | The common HTTP client is the browser.   |
| 4.      | FTP establishes two connection one for data and one for the control connection.                                      | HTTP establishes data connection only.   |
| 5.      | FTP uses TCP's port number 20 and 21.  | HTTP uses TCP's port number 80.  |
| 6.      | If you are using FTP, ftp will appear in URL.  | If you are using HTTP, http will appear in URL.  |
| 7.      | FTP session (stateful).  | No session (stateless).  |
| 8.      | FTP is comparatively simple.   | Web clients and servers became very complex since they need to support many protocols, scripting languages, file types etc. Complexity is also a security problem. |
| 9.      | FTP is better suited (faster, more efficient) for large files.   | HTTP is better suited for the transfer of many small files.  |
| 10.     | FTP has a control and a data connection and communicates TCP port numbers for data connection in control connection. | HTTP uses a single TCP connection for control and data.  |
| 11.     | FTP requires a password.   | HTTP does not require authentication.  |
| 12.     | FTP transmits data as ASCII or binary.   | HTTP always sends data in binary format.   |

| Feature            | FTP   | TFTP  |
|--------------------|---|---|
| Purpose            | Transfer files between computers  | Transfer files between computers  |
| Connection         | Establishes a connection between two computers, allowing for a more complex set of commands and options | Establishes a connection between two computers, but with a more limited set of commands and options |
| Authentication     | Uses username and password for authentication   | Does not support authentication   |
| Security           | Encrypts data transfer  | Does not encrypt data transfer  |
| Error handling     | Can recover from errors during transfer   | Does not have error recovery  |
| File transfer mode | Supports both <u>ASCII</u> and binary transfer modes  | Only supports binary transfer mode  |
| Transfer options   | Supports resuming interrupted transfers and setting transfer mode, transfer type, and other options     | Does not support any transfer options   |

UNIT 5

Table 5.1.6 : Comparison of various mobile system generations

| Sr. No. | Feature              | Generation      |                  |                         |                          |                     |
|---------|----------------------|-----------------|------------------|-------------------------|--------------------------|---------------------|
|         |                      | 1G              | 2G               | 3G                      | 4G                       | 5G                  |
| 1.      | Generation           | First           | Second           | Third                   | Fourth                   | Fifth               |
| 2.      | Year of introduction | 1970            | 1990             | 2001                    | 2010                     | 2020                |
| 3.      | Technology           | Analog cellular | Digital cellular | Broadband, IP, FDD, TDD | IP-broadband Wi-Fi, MIMO | IPv6                |
| 4.      | Standard             | AMPS            | CDMA, TDMA, GSM  | CDMA, UMTS, W-CDMA      | Wi-Max and LTE           | Yet to be finalized |

TechKnowledge

| Advance Computer Network |                | 5-6                        |                          |                               | Wireless Network Technologies |                                       |
|--------------------------|----------------|----------------------------|--------------------------|-------------------------------|-------------------------------|---------------------------------------|
| Sr. No.                  | Feature        | Generation                 |                          |                               |                               |                                       |

| 5.                       | Switching      | Circuit                    | Circuit / Packet         | Circuit/Packet                | Packet                        | packet                                |
| 6.                       | Frequency band | 824-894 MHz                | 850-1900 MHz             | 1.6-2.5 GHz                   | 2-8 GHz                       | 15 GHz                                |
| 7.                       | Data speed     | 2.4 kbps                   | 9.6 kbps                 | 2 Mbps                        | 50 Mbps                       | Higher than 1 Gbps                    |
| 8.                       | Multiplexing   | FDMA                       | CDMA, TDMA               | CDMA                          | MC-CDMA, OFDM                 | MC-CDMA, LAS-CDMA, OFDM               |
| 9.                       | Core network   | PSTN                       | PSTN                     | Packet Network                | Internet                      | Internet                              |
| 10.                      | Services       | Only voice or only message | Digital voice, Data, SMS | High speed data, Voice, Video | Dynamic Information Access    | Interactive multimedia, Voice over IP |

|                  |             |                        |                       |                    |  |
|------------------|-------------|------------------------|-----------------------|--------------------|--|
| Parameter        | 1G (Analog) | 2G (Digital)           | 3G (Mobile Broadband) | 4G (High-Speed IP) | 5G (Next-Gen Network)                  |
| Launch Era       | 1980s       | Early 1990s            | Early 2000s           | Late 2000s         | 2020s                                  |
| Technology       | Analog      | GSM, CDMA              | UMTS, CDMA2000        | LTE, WiMAX         | NR (New Radio), mmWave                 |
| Data Speed       | ~2.4 kbps   | ~64–100 kbps           | ~2 Mbps               | 100 Mbps–1 Gbps    | Up to 10 Gbps                          |
| Latency          | High        | Moderate               | ~100 ms               | ~30–50 ms          | ~1 ms                                  |
| Bandwidth        | Narrow      | Narrow                 | Medium                | Wide               | Ultra-wide                             |
| Modulation       | FM          | GMSK                   | QPSK                  | OFDMA              | OFDMA, Massive MIMO                    |
| Security         | None        | Basic (GSM encryption) | Improved (SSL, VPN)   | Strong (IPSec)     | Advanced (network slicing, encryption) |
| Voice Quality    | Poor        | Good                   | Better                | HD Voice           | Crystal-clear                          |
| Mobility Support | Basic       | Good                   | Excellent             | Excellent          | Seamless handover                      |
| Coverage         | Limited     | Wide                   | Wider                 | Global             | Dense urban + rural                    |
| Power Efficiency | Low         | Moderate               | Moderate              | High               | Very high                              |
| Device Density   | Low         | Low                    | Moderate              | High               | Massive (IoT scale)                    |
| Use Cases        | Voice calls | SMS, voice             | Web browsing, email   | Streaming, gaming  | AR/VR, IoT, automation                 |

**Table 5.3.1 : Comparison of NFV and SDN**

| <b>Sr. No.</b> | <b>Parameter</b>       | <b>Network function virtualization (NFV)</b>                               | <b>Software defined networks (SDN)</b>  |
|----------------|------------------------|--|---|
| 1.             | <b>Formalization</b>   | ETSI (European Telecommunications Standards Institute).                    | Open Networking Foundation (ONF)  |
| 2.             | <b>Basic concept</b>   | Relocate network functions from dedicated applications to generic servers. | Separate control and data, centralize control and programmability of network. |
| 3.             | <b>Target location</b> | Service provider network   | Campus, data center/cloud   |

| SDN   | NFV  |
|---|--|
| SDN architecture mainly focuses on data centers.  | NFV is targeted at service providers or operators.   |
| SDN separates control plane and data forwarding plane by centralizing control and programmability of network. | NFV helps service providers or operators to virtualize functions like load balancing, routing, and policy management by transferring network functions from dedicated appliances to virtual servers. |
| SDN uses OpenFlow as a communication protocol.  | There is no protocol determined yet for NFV.   |
| SDN supports Open Networking Foundation.  | NFV is driven by ETSI NFV Working group.   |
| Various enterprise networking software and hardware vendors are initiative supporters of SDN.                 | Telecom service providers or operators are prime initiative supporters of NFV.   |
| Corporate IT act as a Business initiator for SDN.   | Service providers or operators act as a Business initiator for NFV.  |
| SDN applications run on industry-standard servers or switches.  | NFV applications run on industry-standard servers.   |
| SDN reduces cost of network because now there is no need of expensive switches & routers.                     | NFV increases scalability and agility as well as speed up time-to-market as it dynamically allot hardware a level of capacity to network functions needed at a particular time.                      |
| Application of SDN: <ul style="list-style-type: none"> <li>Networking</li> </ul>                              | Application of NFV: <ul style="list-style-type: none"> <li>Routers, firewalls, gateways</li> </ul>   |

| SDN   | NFV   |
|---|---|
| <ul style="list-style-type: none"> <li>Cloud orchestration</li> </ul> | <ul style="list-style-type: none"> <li>WAN accelerators</li> <li>SLA assurance</li> <li>Video Servers</li> <li>Content Delivery Networks (CDN)</li> </ul> |

| Sr. No. | Parameter      | Network function virtualization (NFV)  | Software defined networks (SDN) |
|---------|----------------|--|---------------------------------|
| 4.      | Target devices | Commodity servers and switches   | Commodity servers and switches  |
| 5.      | Applications   | Routers, firewalls, gateways, content delivery network, WAN accelerators, SLA assurance. | Networking                      |
| 6.      | New protocol   | None   | Openflow                        |

(GT-68) Table 5.11.1 : Comparison of stored, live and interactive streaming

| Sr. No. | Parameter of comparison    | Streaming of   |  |  |
|---------|----------------------------|--|--|--|
|         |                            | Stored audio / video   | Live audio / video                                   | Interactive audio / video                          |
| 1.      | Principle of operation     | The prerecorded audio / video contents on a server, that a client can download | Audio / video contents are broadcast on the internet | People communicate via audio / video, in real time |
| 2.      | Real time aspect           | Not applicable   | Not applicable                                       | Real time interactive communication                |
| 3.      | Need of downloading        | Downloading is needed at the client  | Not needed   | Not needed   |
| 4.      | Examples                   | Audio on demand, video on demand   | Internet radio, internet TV                          | Video conferencing                                 |
| 5.      | Sensitivity to delays      | System is sensitive to delays  | Yes, sensitive to delays                             | Yes, sensitive to delays                           |
| 6.      | Type of communication      | Unicast & on demand  | Multicast and live                                   | Multicast and live                                 |
| 7.      | Retransmission request     | Not accepted   | Not accepted   | Not accepted                                       |
| 8.      | Direction of communication | One way  | One way  | Two way  |
| 9.      | Protocols used             | HTTP, RTSP, IP   | RTP, UDP, IP, TCP                                    | UDP, TCP, IP                                       |

**Comparison of 3G vs 4G vs 5G:**

| Feature                 | 3G                | 4G                   | 4G+ (LTE Advanced)     | 5G                               |
|-------------------------|-------------------|----------------------|------------------------|----------------------------------|
| Peak Data Rate          | Up to 42 Mbps     | Up to 1 Gbps         | Up to 3 Gbps           | Up to 20 Gbps                    |
| Latency                 | 100-500 ms        | 20-30 ms             | 10-20 ms               | 1-4 ms                           |
| Frequency Bands         | 850 MHz - 2.1 GHz | 600 MHz - 2.5 GHz    | 600 MHz - 6 GHz        | 600 MHz - 100 GHz                |
| Network Architecture    | Circuit-Switched  | Packet-Switched      | Packet-Switched        | Packet-Switched, Virtualized     |
| Download/Upload Speed   | 3-7 Mbps / 1 Mbps | 10-50 Mbps / 10 Mbps | 100-150 Mbps / 50 Mbps | 100 Mbps-10 Gbps / Up to 10 Gbps |
| Use Cases               | Voice, SMS, MMS   | Streaming, VoIP, Web | HD Streaming, IoT      | IoT, VR/AR, Autonomous Vehicles  |
| Backwards Compatibility | 2G                | 3G, some 2G          | 4G, 3G                 | 4G, 3G, 2G                       |

**Difference between SDN and NFV:**

| Features                     | SDN   | NFV  |
|------------------------------|---|--|
| Scope                        | SDN is primarily focused on the control and management of network traffic flows.  | NFV is focused on the virtualization and management of network functions.  |
| Functionality                | SDN separates the control plane (which determines how traffic is routed) from the data plane (which handles the actual transmission of data), allowing for more flexible and programmable network management. | NFV virtualizes network functions such as routing, switching, firewalling, and load balancing, allowing these functions to be deployed and managed as software-based virtual network functions (VNFs). |
| Deployment                   | SDN typically requires specialized network hardware, such as switches and routers, that support OpenFlow or other SDN protocols.  | NFV can be deployed on standard x86 servers, storage, and switches.  |
| Management and Orchestration | SDN typically relies on centralized controllers that manage and orchestrate network traffic flows.  | NFV also requires management and orchestration, but this is typically focused on the deployment and management of VNFs.  |
| Standards                    | SDN is primarily defined by the Open Networking Foundation (ONF) and the OpenFlow protocol.   | NFV is defined by the European Telecommunications Standards Institute (ETSI) and its NFV Industry Specification Group (ISG).   |
|                              | <b>Note:</b> Both technologies are based on open standards, there are some differences in the specific standards and protocols used by each.  |  |

|                      |   |  |
|----------------------|---|--|
| Network Architecture | SDN is typically used to create a centralized, software-defined network architecture that is more programmable and easier to manage.  | NFV, on the other hand, is focused on virtualizing network functions to create a more flexible and scalable network architecture.                    |
| Network Abstraction  | SDN abstracts the network infrastructure from the control plane, allowing network administrators to define network policies and configurations that are separate from the underlying hardware.    | NFV abstracts network functions from the underlying hardware, allowing them to be deployed and managed independently of the physical infrastructure. |
| Service Delivery     | SDN can be used to enable new service delivery models, such as network slicing, that allow network resources to be allocated dynamically based on the needs of specific applications or services. | NFV can also enable new service delivery models by allowing network functions to be deployed and scaled up or down based on demand.                  |
| Vendor Ecosystem     | SDN has a larger and more mature vendor ecosystem than NFV, with a wide range of products and solutions available from established networking vendors as well as startups.                        | NFV is still a relatively new technology, and the vendor ecosystem is still evolving.  |

**Difference between Edge computing and Edge networking:**

| Feature             | Edge Computing   | Edge Networking   |
|---------------------|--|---|
| Definition          | Processing data at or near the source of data generation.        | The communication infrastructure that connects edge devices.          |
| Main Goal           | Reduce latency by minimizing the need to send data to the cloud. | Ensure data can travel efficiently between edge devices and networks. |
| Focus Area          | Computation and data processing.                                 | Data transmission and connectivity.                                   |
| Key Components      | Edge servers, gateways, local devices with processing power.     | Routers, switches, edge routers, network protocols.                   |
| Example Use Case    | A factory floor machine analyzing sensor data locally.           | Enabling 5G connectivity to smart traffic lights.                     |
| Reduces Load On     | Cloud servers and data centers. Cloud servers and data centers.  | Backbone networks and central routers.                                |
| Latency             | Ultra-low, as processing happens locally.                        | Low, optimized by shorter data travel routes.                         |
| Dependency          | Relies on edge networking for connectivity.                      | Relies on edge computing to process and act on data locally.          |
| Common Technologies | AI at the edge, local data analytics, edge containers.           | SD-WAN, 5G, edge switches, network slicing.                           |

| Feature           | Edge Computing  | Edge Networking                                     |
|-------------------|---|---|
| Definition        | Processing data near the source (e.g., IoT devices)       | Connecting devices and systems at the network edge  |
| Primary Function  | Compute and store data locally                            | Route and manage data traffic efficiently           |
| Focus Area        | Data processing and analytics                             | Data transmission and connectivity                  |
| Key Components    | Edge servers, micro data centers, IoT processors          | Routers, switches, gateways, access points          |
| Latency Impact    | Reduces latency by avoiding cloud round-trips             | Optimizes latency through efficient routing         |
| Use Cases         | Real-time analytics, autonomous vehicles, smart factories | CDN delivery, 5G networks, IoT device communication |
| Relation to Cloud | Complements cloud by offloading tasks                     | Connects edge devices to cloud or central systems   |

|               |   |   |
|---------------|---|---|
| Feature       | Edge Computing                            | Edge Networking                             |
| Security Role | Ensures local data privacy and compliance | Secures data in transit across edge devices |

used in multimedia streaming.

| Feature          | RTP  | RTSP  |
|------------------|--|---|
| Definition       | A transport protocol designed to transmit audio and video data in real time.             | A control protocol used to manage and control streaming media sessions between clients and servers. |
| Primary Function | Handles the actual transmission of multimedia data (e.g., audio, video).                 | Provides commands for session control (e.g., play, pause, stop, teardown).                          |
| Role             | Focuses on delivering media packets efficiently with synchronization and jitter control. | Acts as a "remote control" for managing media streams but does not transmit the media itself.       |

Advance Computer Network

|                      |   |  |
|----------------------|---|--|
| Data Transmission    | Operates over UDP/IP to ensure low latency in delivering multimedia packets.                          | Establishes control connections over TCP to manage sessions; uses RTP for actual data transmission.      |
| Session Control      | Does not provide session control; only transmits data.  | Enables session setup, playback control, and termination using commands like PLAY or PAUSE.              |
| Protocol Interaction | Works alongside RTCP for feedback on stream quality.  | Works with RTP to transport media after negotiating session parameters.                                  |
| Use Cases            | Used in live streaming, VoIP (Voice over IP), and video conferencing for transmitting real-time data. | Commonly used for video surveillance (IP cameras), IPTV, and interactive video-on-demand services.       |
| Scenarios            | Ideal for transmitting raw multimedia data efficiently across networks.                               | Suitable for applications requiring user interaction with streams, such as pausing or rewinding content. |
| Synchronization      | Provides mechanisms for synchronizing audio and video streams.  | Allows segmented streaming so users can start viewing before full download.                              |
| Functionality        | RTP focuses solely on transporting multimedia data.   | RTSP is responsible for controlling how the multimedia is streamed.                                      |
| Protocol Dependency  | RTP can function independently for raw media transmission.  | RTSP relies on RTP (and sometimes RTCP) to handle actual media delivery.                                 |
| Use Case Focus       | RTP is ideal for applications requiring efficient data transfer, such as live broadcasting.           | RTSP is better suited for interactive applications like surveillance systems or video-on-demand.         |

|                    |   |  |
|--------------------|---|--|
| Feature            | RTP (Real-time Transport Protocol)        | RTSP (Real-time Streaming Protocol)                |
| Purpose            | Transports real-time audio and video data | Controls the streaming session (play, pause, etc.) |
| Protocol Layer     | Transport layer (typically over UDP)      | Application layer (typically over TCP)             |
| Function           | Delivers media packets in real time       | Manages and controls media delivery                |
| Direction          | One-way (server to client)                | Bi-directional (client ↔ server)                   |
| Transport Protocol | Usually UDP (sometimes TCP)               | Usually TCP  |
| Session Control    | No session control                        | Provides session control (start, stop, seek)       |
| Used With          | Often used with RTSP or SIP               | Often used alongside RTP for control               |
| Example Use Case   | Streaming live video/audio                | Controlling playback of a video stream             |
